I was very excited to see your post because I am trying to set up a bunch of those in an atomix v-box. I am working from a github that has a description of the way to create the atomix v-box with atomix v8 and uTorrent. I just started installing atomix v8 on my mac and I am not getting the atomix v-box. I have a folder called atomix-v8-linux-install-root/atomix-v8-linux-install-root. I have already done the post install. I can see the atomix v-box as the top level item in atomix-v8-linux-install-root. I am not getting the atomix v-box in my atomix-v8-linux-install-root. I did the step to add the rpms to the apt-get install and I am getting an error. I am not sure if the error is due to the error you had with the post install. It might have something to do with my error. I was trying to install atomix v8. I downloaded the atomix 8 tar.gz file and then used the post install. I downloaded the atomix_v8_linux_install_root.tar.gz file from github. I extracted the contents of the atomix_v8_linux_install_root.tar.gz file into the atomix-v8-linux-install-root directory. The atomix_v8_linux_install_root.tar.gz file has a directory named post_install. I then ran the following command to add the rpms that were in the atomix_v8_linux_install_root.tar.gz file. I am not sure if I made a mistake but I did not get the atomix v-box. I am going to try to install the atomix v8 with the tar.gz file again. It is at the moment I am working on. I hope this helps. I am trying to install the atomix v8 with the tar.gz file. I downloaded the atomix 8.tar.gz file and then used the post install. I downloaded the atomix_v8_linux_install_root.tar.gz file from github. I extracted the contents of the atomix_v8_linux_install_root.tar.gz file into the atomix 82157476af
